Microscopy & Imaging

The Bioimaging Center of the Faculty of Sciences and iGE3 is offering its course on light microscopy again. The course is directed to those interested in microscopy and especially to current and future users of the Bioimaging Center. The course will cover training on widefield and confocal microscopes, immunofluorescence labeling and some basics on live cell imaging.

We are limited in the number of participants and ask therefore candidates to write a short letter of motivation. Response to applications will be given during the week after the deadline.

The course is included in the program of the UNIGE with the number 14B063. It can be taken as part of the master program in biology and biochemistry. To obtain credit points participants need to pass an exam.
